1 Introduction

This document is a reference manual for the Markdown package. It is split into three sections. This section explains the purpose and the background of the package and outlines its prerequisites. Section 2 describes the interfaces exposed by the package along with usage notes and examples. It is aimed at the user of the package. Section 3 describes the implementation of the package. It is aimed at the developer of the package and the curious user.

1.1 About Markdown

The Markdown package provides facilities for the conversion of markdown markup to plain \TeX . These are provided both in the form of a Lua module and in the form of plain \TeX , \LaTeX , and Con \TeX t macro packages that enable the direct inclusion of markdown documents inside \TeX documents.

Architecturally, the package consists of the Lunamark v0.5.0 Lua module by John MacFarlane, which was slimmed down and rewritten for the needs of the package. On top of Lunamark sits code for the plain \TeX , \LaTeX , and Con \TeX t formats by Vít Novotný.

```
1 local metadata = {
2     version    = "2.5.0",
3     comment    = "A module for the conversion from markdown to plain TeX",
4     author     = "John MacFarlane, Hans Hagen, Vít Novotný",
5     copyright  = "2009–2017 John MacFarlane, Hans Hagen; " ..
```

```

6           "2016–2017 Vít Novotný",
7   license    = "LPPL 1.3"
8 }
9 if not modules then modules = {} end
10 modules['markdown'] = metadata

```

1.2 Feedback

Please use the markdown project page on GitHub¹ to report bugs and submit feature requests. Before making a feature request, please ensure that you have thoroughly studied this manual. If you do not want to report a bug or request a feature but are simply in need of assistance, you might want to consider posting your question on the TeX-LaTeX Stack Exchange².

1.3 Acknowledgements

I would like to thank the Faculty of Informatics at the Masaryk University in Brno for providing me with the opportunity to work on this package alongside my studies. I would also like to thank the creator of the Lunamark Lua module, John Macfarlane, for releasing Lunamark under a permissive license that enabled its inclusion into the package.

The TeX part of the package draws inspiration from several sources including the source code of $\text{\LaTeX} 2\epsilon$, the minted package by Geoffrey M. Poore – which likewise tackles the issue of interfacing with an external interpreter from TeX, the filecontents package by Scott Pakin, and others.

1.4 Prerequisites

This section gives an overview of all resources required by the package.

1.4.1 Lua Prerequisites

The Lua part of the package requires that the following Lua modules are available from within the LuaTeX engine:

LPeg ≥ 0.10 A pattern-matching library for the writing of recursive descent parsers via the Parsing Expression Grammars (PEGs). It is used by the Lunamark library to parse the markdown input. LPeg ≥ 0.10 is included in LuaTeX $\geq 0.72.0$ (TeXLive ≥ 2013).

```
11 local lpeg = require("lpeg")
```

¹<https://github.com/witiko/markdown/issues>

²<https://tex.stackexchange.com>

Selene Unicode A library that provides support for the processing of wide strings. It is used by the Lunamark library to cast image, link, and footnote tags to the lower case. Selene Unicode is included in all releases of LuaTeX (TeXLive \geq 2008).

```
12 local unicode = require("unicode")
```

MD5 A library that provides MD5 crypto functions. It is used by the Lunamark library to compute the digest of the input for caching purposes. MD5 is included in all releases of LuaTeX (TeXLive \geq 2008).

```
13 local md5 = require("md5")
```

All the abovelisted modules are statically linked into the current version of the LuaTeX engine (see [1, Section 3.3]).

1.4.2 Plain TeX Prerequisites

The plain TeX part of the package requires that the plain TeX format (or its superset) is loaded, all the Lua prerequisites (see Section 1.4.1) and the following Lua module:

Lua File System A library that provides access to the filesystem via os-specific syscalls. It is used by the plain TeX code to create the cache directory specified by the `\markdownOptionCacheDir` macro before interfacing with the Lunamark library. Lua File System is included in all releases of LuaTeX (TeXLive \geq 2008).

The plain TeX code makes use of the `isdir` method that was added to the Lua File System library by the LuaTeX engine developers (see [1, Section 3.2]).

The Lua File System module is statically linked into the LuaTeX engine (see [1, Section 3.3]).

The plain TeX part of the package also requires that either the LuaTeX `\directlua` primitive or the shell access file stream 18 is available in your TeX engine. If only the shell access file stream is available in your TeX engine (as is the case with pdfTeX and XeTeX) or if you enforce the use of shell using the `\markdownMode` macro, then note the following:

- Unless your TeX engine is globally configured to enable shell access, you will need to provide the `-shell-escape` parameter to your engine when typesetting a document.
- You will need to avoid the use of the `-output-directory` TeX parameter when typesetting a document. The parameter causes auxiliary files to be written to a specified output directory, but the shell will be executed in the current directory. Things will not work out.

1.4.3 L^AT_EX Prerequisites

The L^AT_EX part of the package requires that the L^AT_EX 2_E format is loaded,

14 \NeedsTeXFormat{LaTeX2e} %

all the plain T_EX prerequisites (see Section 1.4.2), and the following L^AT_EX 2_E packages:

keyval A package that enables the creation of parameter sets. This package is used to provide the `\markdownSetup` macro, the package options processing, as well as the parameters of the `markdown*` L^AT_EX environment.

url A package that provides the `\url` macro for the typesetting of URLs. It is used to provide the default token renderer prototype (see Section 2.2.4) for links.

graphicx A package that provides the `\includegraphics` macro for the typesetting of images. It is used to provide the corresponding default token renderer prototype (see Section 2.2.4).

paralist A package that provides the `compactitem`, `compactenum`, and `compactdesc` macros for the typesetting of tight bulleted lists, ordered lists, and definition lists. It is used to provide the corresponding default token renderer prototypes (see Section 2.2.4).

ifthen A package that provides a concise syntax for the inspection of macro values. It is used to determine whether or not the paralist package should be loaded based on the user options.

fancyvrb A package that provides the `\VerbatimInput` macros for the verbatim inclusion of files containing code. It is used to provide the corresponding default token renderer prototype (see Section 2.2.4).

csvsimple A package that provides the default token renderer prototype for iA Writer content blocks with the csv filename extension (see Section 2.2.4).

1.4.4 ConTeXt prerequisites

The ConTeXt part of the package requires that either the Mark II or the Mark IV format is loaded, all the plain T_EX prerequisites (see Section 1.4.2), and the following modules:

m-database A module that provides the default token renderer prototype for iA Writer content blocks with the csv filename extension (see Section 2.2.4).

2 User Guide

This part of the manual describes the interfaces exposed by the package along with usage notes and examples. It is aimed at the user of the package.

Since neither \TeX nor Lua provide interfaces as a language construct, the separation to interfaces and implementations is purely abstract. It serves as a means of structuring this manual and as a promise to the user that if they only access the package through the interfaces, the future versions of the package should remain backwards compatible.

2.1 Lua Interface

The Lua interface provides the conversion from UTF-8 encoded markdown to plain \TeX . This interface is used by the plain \TeX implementation (see Section 3.2) and will be of interest to the developers of other packages and Lua modules.

The Lua interface is implemented by the `markdown` Lua module.

```
15 local M = {}
```

2.1.1 Conversion from Markdown to Plain \TeX

The Lua interface exposes the `new(options)` method. This method creates converter functions that perform the conversion from markdown to plain \TeX according to the table `options` that contains options recognized by the Lua interface. (see Section 2.1.2). The `options` parameter is optional; when unspecified, the behaviour will be the same as if `options` were an empty table.

The following example Lua code converts the markdown string `_Hello world!_` to a \TeX output using the default options and prints the \TeX output:

```
local md = require("markdown")
local convert = md.new()
print(convert("_Hello world!_"))
```

2.1.2 Options

The Lua interface recognizes the following options. When unspecified, the value of a key is taken from the `defaultOptions` table.

```
16 local defaultOptions = {}
```

```

blankBeforeBlockquote=true, false                                default: false

    true      Require a blank line between a paragraph and the following blockquote.
    false     Do not require a blank line between a paragraph and the following
              blockquote.

17 defaultOptions.blankBeforeBlockquote = false

blankBeforeCodeFence=true, false                                default: false

    true      Require a blank line between a paragraph and the following fenced
              code block.
    false     Do not require a blank line between a paragraph and the following
              fenced code block.

18 defaultOptions.blankBeforeCodeFence = false

blankBeforeHeading=true, false                                default: false

    true      Require a blank line between a paragraph and the following header.
    false     Do not require a blank line between a paragraph and the following
              header.

19 defaultOptions.blankBeforeHeading = false

breakableBlockquotes=true, false                                default: false

    true      A blank line separates block quotes.
    false     Blank lines in the middle of a block quote are ignored.

20 defaultOptions.breakableBlockquotes = false

cacheDir=<directory name>                                    default: .

The path to the directory containing auxiliary cache files.

When iteratively writing and typesetting a markdown document, the cache files are
going to accumulate over time. You are advised to clean the cache directory every
now and then, or to set it to a temporary filesystem (such as /tmp on UN*X systems),
which gets periodically emptied.

21 defaultOptions.cacheDir = "."

```

<code>citationNbsps=true, false</code>	default: false
true	Replace regular spaces with non-breakable spaces inside the prenotes and postnotes of citations produced via the pandoc citation syntax extension.
false	Do not replace regular spaces with non-breakable spaces inside the prenotes and postnotes of citations produced via the pandoc citation syntax extension.
22 <code>defaultOptions.citationNbsps = true</code>	
<code>citations=true, false</code>	default: false
true	Enable the pandoc citation syntax extension: <div style="border: 1px solid black; padding: 10px;"><p>Here is a simple parenthetical citation [@doe99] and here is a string of several [see @doe99, pp. 33-35; also @smith04, chap. 1].</p><p>A parenthetical citation can have a [prenote @doe99] and a [@smith04 postnote]. The name of the author can be suppressed by inserting a dash before the name of an author as follows [-@smith04].</p><p>Here is a simple text citation @doe99 and here is a string of several @doe99 [pp. 33-35; also @smith04, chap. 1]. Here is one with the name of the author suppressed -@doe99.</p></div>
false	Disable the pandoc citation syntax extension.
23 <code>defaultOptions.citations = false</code>	
<code>codeSpans=true, false</code>	default: true
true	Enable the code span syntax: <div style="border: 1px solid black; padding: 10px;"><p>Use the ‘printf()’ function. ‘‘There is a literal backtick (`) here.’’</p></div>
false	Disable the code span syntax. This allows you to easily use the quotation mark ligatures in texts that do not contain code spans: <div style="border: 1px solid black; padding: 10px;"><p>‘‘This is a quote.’’</p></div>
24 <code>defaultOptions.codeSpans = true</code>	

`contentBlocks=true, false` default: `false`

`true` Enable the iA Writer content blocks syntax extension [2]:

```
http://example.com/minard.jpg (Napoleon's disastrous  
Russian campaign of 1812)  
/Flowchart.png "Engineering Flowchart"  
/Savings Account.csv 'Recent Transactions'  
/Example.swift  
/Lorem Ipsum.txt
```

`false` Disable the iA Writer content blocks syntax extension.

`25 defaultOptions.contentBlocks = false`

`contentBlocksLanguageMap=<filename>`

default: `markdown-languages.json`

The filename of the JSON file that maps filename extensions to programming language names in the iA Writer content blocks. See Section 2.2.3.9 for more information.

`26 defaultOptions.contentBlocksLanguageMap = "markdown-languages.json"`

`definitionLists=true, false` default: `false`

`true` Enable the pandoc definition list syntax extension:

```
Term 1  
  
: Definition 1  
  
Term 2 with *inline markup*  
  
: Definition 2  
  
{ some code, part of Definition 2 }  
  
Third paragraph of definition 2.
```

`false` Disable the pandoc definition list syntax extension.

`27 defaultOptions.definitionLists = false`

`fencedCode=true, false` default: `false`

`true` Enable the commonmark fenced code block extension:

```
~~~ js
if (a > 3) {
    moveShip(5 * gravity, DOWN);
}
~~~~~

``` html
<pre>
<code>
// Some comments
line 1 of code
line 2 of code
line 3 of code
</code>
</pre>
```

```

`false` Disable the commonmark fenced code block extension.

`28 defaultOptions.fencedCode = false`

`footnotes=true, false` default: `false`

`true` Enable the pandoc footnote syntax extension:

```
Here is a footnote reference,[^1] and another.[^longnote]
[^1]: Here is the footnote.

[^longnote]: Here's one with multiple blocks.

Subsequent paragraphs are indented to show that they
belong to the previous footnote.

{ some.code }

The whole paragraph can be indented, or just the
first line. In this way, multi-paragraph footnotes
work like multi-paragraph list items.
```

| | |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | This paragraph won't be part of the note, because it isn't indented. |
| <code>false</code> | Disable the pandoc footnote syntax extension. |
| <code>29 defaultOptions.footnotes = false</code> | |
| <code>hashEnumerators=true, false</code> | default: <code>false</code> |
| <code>true</code> | Enable the use of hash symbols (#) as ordered item list markers: |
| | <pre>#. Bird #. McHale #. Parish</pre> |
| <code>false</code> | Disable the use of hash symbols (#) as ordered item list markers. |
| <code>30 defaultOptions.hashEnumerators = false</code> | |
| <code>html=true, false</code> | default: <code>false</code> |
| <code>true</code> | Enable the recognition of HTML tags, block elements, comments, HTML instructions, and entities in the input. Tags, block elements (along with contents), HTML instructions, and comments will be ignored and HTML entities will be replaced with the corresponding Unicode codepoints. |
| <code>false</code> | Disable the recognition of HTML markup. Any HTML markup in the input will be rendered as plain text. |
| <code>31 defaultOptions.html = false</code> | |
| <code>hybrid=true, false</code> | default: <code>false</code> |
| <code>true</code> | Disable the escaping of special plain TeX characters, which makes it possible to intersperse your markdown markup with TeX code. The intended usage is in documents prepared manually by a human author. In such documents, it can often be desirable to mix TeX and markdown markup freely. |
| <code>false</code> | Enable the escaping of special plain TeX characters outside verbatim environments, so that they are not interpreted by TeX. This is encouraged when typesetting automatically generated content or markdown documents that were not prepared with this package in mind. |
| <code>32 defaultOptions.hybrid = false</code> | |

```

inlineFootnotes=true, false default: false

  true      Enable the pandoc inline footnote syntax extension:
  

Here is an inline note.33[Inlines notes are easier to write, since you don't have to pick an identifier and move down to type the note.]

false     Disable the pandoc inline footnote syntax extension.

  33 defaultOptions.inlineFootnotes = false

preserveTabs=true, false default: false

  true      Preserve all tabs in the input.
  false     Convert any tabs in the input to spaces.

  34 defaultOptions.preserveTabs = false

smartEllipses=true, false default: false

  true      Convert any ellipses in the input to the \markdownRendererEllipsis TeX macro.
  false     Preserve all ellipses in the input.

  35 defaultOptions.smartEllipses = false

startNumber=true, false default: true

  true      Make the number in the first item in ordered lists significant. The item numbers will be passed to the \markdownRendererOlItemWithNumber TeX macro.
  false     Ignore the number in the items of ordered lists. Each item will only produce a \markdownRendererOlItem TeX macro.

  36 defaultOptions.startNumber = true

```

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>tightLists=true, false</code> | default: true |
| <code>true</code> | Lists whose bullets do not consist of multiple paragraphs will be detected and passed to the <code>\markdownRendererOlBeginTight</code> , <code>\markdownRendererOlEndTight</code> , <code>\markdownRendererUlBeginTight</code> , <code>\markdownRendererUlEndTight</code> , <code>\markdownRendererDlBeginTight</code> , and <code>\markdownRendererDlEndTight</code> macros. |
| <code>false</code> | Lists whose bullets do not consist of multiple paragraphs will be treated the same way as lists that do. |

37 `defaultOptions.tightLists = true`

| | |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>underscores=true, false</code> | default: true |
| <code>true</code> | Both underscores and asterisks can be used to denote emphasis and strong emphasis: |
| <code>false</code> | Only asterisks can be used to denote emphasis and strong emphasis. This makes it easy to write math with the <code>hybrid</code> option without the need to constantly escape subscripts. |

38 `defaultOptions.underscores = true`

2.2 Plain \TeX Interface

The plain \TeX interface provides macros for the typesetting of markdown input from within plain \TeX , for setting the Lua interface options (see Section 2.1.2) used during the conversion from markdown to plain \TeX , and for changing the way markdown the tokens are rendered.

39 `\def\markdownLastModified{2017/04/10}%`

40 `\def\markdownVersion{2.5.0}%`

The plain \TeX interface is implemented by the `markdown.tex` file that can be loaded as follows:

```
\input markdown
```

It is expected that the special plain \TeX characters have the expected category codes, when `\input`ting the file.

2.2.1 Typesetting Markdown

The interface exposes the `\markdownBegin`, `\markdownEnd`, and `\markdownInput` macros.

The `\markdownBegin` macro marks the beginning of a markdown document fragment and the `\markdownEnd` macro marks its end.

```
41 \let\markdownBegin\relax  
42 \let\markdownEnd\relax
```

You may prepend your own code to the `\markdownBegin` macro and redefine the `\markdownEnd` macro to produce special effects before and after the markdown block.

There are several limitations to the macros you need to be aware of. The first limitation concerns the `\markdownEnd` macro, which must be visible directly from the input line buffer (it may not be produced as a result of input expansion). Otherwise, it will not be recognized as the end of the markdown string otherwise. As a corollary, the `\markdownEnd` string may not appear anywhere inside the markdown input.

Another limitation concerns spaces at the right end of an input line. In markdown, these are used to produce a forced line break. However, any such spaces are removed before the lines enter the input buffer of TeX (see [3, p. 46]). As a corollary, the `\markdownBegin` macro also ignores them.

The `\markdownBegin` and `\markdownEnd` macros will also consume the rest of the lines at which they appear. In the following example plain TeX code, the characters `c`, `e`, and `f` will not appear in the output.

```
\input markdown  
a  
b \markdownBegin c  
d  
e \markdownEnd f  
g  
\bye
```

Note that you may also not nest the `\markdownBegin` and `\markdownEnd` macros.

The following example plain TeX code showcases the usage of the `\markdownBegin` and `\markdownEnd` macros:

```
\input markdown  
\markdownBegin  
_Hello_ **world** ...  
\markdownEnd  
\bye
```

The `\markdownInput` macro accepts a single parameter containing the filename of a markdown document and expands to the result of the conversion of the input markdown document to plain \TeX .

```
43 \let\markdownInput\relax
```

This macro is not subject to the abovelisted limitations of the `\markdownBegin` and `\markdownEnd` macros.

The following example plain \TeX code showcases the usage of the `\markdownInput` macro:

```
\input markdown
\markdownInput{hello.md}
\bye
```

2.2.2 Options

The plain \TeX options are represented by \TeX macros. Some of them map directly to the options recognized by the Lua interface (see Section 2.1.2), while some of them are specific to the plain \TeX interface.

2.2.2.1 File and directory names The `\markdownOptionHelperScriptFileName` macro sets the filename of the helper Lua script file that is created during the conversion from markdown to plain \TeX in \TeX engines without the `\directlua` primitive. It defaults to `\jobname.markdown.lua`, where `\jobname` is the base name of the document being typeset.

The expansion of this macro must not contain quotation marks ("") or backslash symbols (\). Mind that \TeX engines tend to put quotation marks around `\jobname`, when it contains spaces.

```
44 \def\markdownOptionHelperScriptFileName{\jobname.markdown.lua}%
```

The `\markdownOptionInputTempFileName` macro sets the filename of the temporary input file that is created during the conversion from markdown to plain \TeX in \TeX engines without the `\directlua` primitive. It defaults to `\jobname.markdown.out`. The same limitations as in the case of the `\markdownOptionHelperScriptFileName` macro apply here.

```
45 \def\markdownOptionInputTempFileName{\jobname.markdown.in}%
```

The `\markdownOptionOutputTempFileName` macro sets the filename of the temporary output file that is created during the conversion from markdown to plain \TeX in \TeX engines without the `\directlua` primitive. It defaults to `\jobname.markdown.out`. The same limitations apply here as in the case of the `\markdownOptionHelperScriptFileName` macro.

```
46 \def\markdownOptionOutputTempFileName{\jobname.markdown.out}%
```

The `\markdownOptionCacheDir` macro corresponds to the Lua interface `cacheDir` option that sets the name of the directory that will contain the produced cache files. The option defaults to `_markdown_\jobname`, which is a similar naming scheme to the one used by the minted L^AT_EX package. The same limitations apply here as in the case of the `\markdownOptionHelperScriptFileName` macro.

```
47 \def\markdownOptionCacheDir{./_markdown_\jobname}%
```

2.2.2.2 Lua Interface Options The following macros map directly to the options recognized by the Lua interface (see Section 2.1.2) and are not processed by the plain T_EX implementation, only passed along to Lua. They are undefined, which makes them fall back to the default values provided by the Lua interface.

For the macros that correspond to the non-boolean options recognized by the Lua interface, the same limitations apply here in the case of the `\markdownOptionHelperScriptFileName` macro.

```
48 \let\markdownOptionBlankBeforeBlockquote\undefined
49 \let\markdownOptionBlankBeforeCodeFence\undefined
50 \let\markdownOptionBlankBeforeHeading\undefined
51 \let\markdownOptionBreakableBlockquotes\undefined
52 \let\markdownOptionCitations\undefined
53 \let\markdownOptionCitationNbsps\undefined
54 \let\markdownOptionContentBlocks\undefined
55 \let\markdownOptionContentBlocksLanguageMap\undefined
56 \let\markdownOptionDefinitionLists\undefined
57 \let\markdownOptionFootnotes\undefined
58 \let\markdownOptionFencedCode\undefined
59 \let\markdownOptionHashEnumerators\undefined
60 \let\markdownOptionHtml\undefined
61 \let\markdownOptionHybrid\undefined
62 \let\markdownOptionInlineFootnotes\undefined
63 \let\markdownOptionPreserveTabs\undefined
64 \let\markdownOptionSmartEllipses\undefined
65 \let\markdownOptionStartNumber\undefined
66 \let\markdownOptionTightLists\undefined
```

2.2.3 Token Renderers

The following T_EX macros may occur inside the output of the converter functions exposed by the Lua interface (see Section 2.1.1) and represent the parsed markdown tokens. These macros are intended to be redefined by the user who is typesetting a document. By default, they point to the corresponding prototypes (see Section 2.2.4).

2.2.3.1 Interblock Separator Renderer The `\markdownRendererInterblockSeparator` macro represents a separator between two markdown block elements. The macro receives no arguments.

```
67 \def\markdownRendererInterblockSeparator{%
68   \markdownRendererInterblockSeparatorPrototype}%
```

2.2.3.2 Line Break Renderer The `\markdownRendererLineBreak` macro represents a forced line break. The macro receives no arguments.

```
69 \def\markdownRendererLineBreak{%
70   \markdownRendererLineBreakPrototype}%
```

2.2.3.3 Ellipsis Renderer The `\markdownRendererEllipsis` macro replaces any occurrence of ASCII ellipses in the input text. This macro will only be produced, when the `smartEllipses` option is `true`. The macro receives no arguments.

```
71 \def\markdownRendererEllipsis{%
72   \markdownRendererEllipsisPrototype}%
```

2.2.3.4 Non-breaking Space Renderer The `\markdownRendererNbsp` macro represents a non-breaking space.

```
73 \def\markdownRendererNbsp{%
74   \markdownRendererNbspPrototype}%
```

2.2.3.5 Special Character Renderers The following macros replace any special plain TeX characters (including the active pipe character (`|`) of ConTeXt) in the input text. These macros will only be produced, when the `hybrid` option is `false`.

```
75 \def\markdownRendererLeftBrace{%
76   \markdownRendererLeftBracePrototype}%
77 \def\markdownRendererRightBrace{%
78   \markdownRendererRightBracePrototype}%
79 \def\markdownRendererDollarSign{%
80   \markdownRendererDollarSignPrototype}%
81 \def\markdownRendererPercentSign{%
82   \markdownRendererPercentSignPrototype}%
83 \def\markdownRendererAmpersand{%
84   \markdownRendererAmpersandPrototype}%
85 \def\markdownRendererUnderscore{%
86   \markdownRendererUnderscorePrototype}%
87 \def\markdownRendererHash{%
88   \markdownRendererHashPrototype}%
89 \def\markdownRendererCircumflex{%
90   \markdownRendererCircumflexPrototype}%
91 \def\markdownRendererBackslash{%
92   \markdownRendererBackslashPrototype}%
```

```
93 \def\markdownRendererTilde{%
94   \markdownRendererTildePrototype}%
95 \def\markdownRendererPipe{%
96   \markdownRendererPipePrototype}%
```

2.2.3.6 Code Span Renderer The `\markdownRendererCodeSpan` macro represents inlined code span in the input text. It receives a single argument that corresponds to the inlined code span.

```
97 \def\markdownRendererCodeSpan{%
98   \markdownRendererCodeSpanPrototype}%
```

2.2.3.7 Link Renderer The `\markdownRendererLink` macro represents a hyperlink. It receives four arguments: the label, the fully escaped URI that can be directly typeset, the raw URI that can be used outside typesetting, and the title of the link.

```
99 \def\markdownRendererLink{%
100   \markdownRendererLinkPrototype}%
```

2.2.3.8 Image Renderer The `\markdownRendererImage` macro represents an image. It receives four arguments: the label, the fully escaped URI that can be directly typeset, the raw URI that can be used outside typesetting, and the title of the link.

```
101 \def\markdownRendererImage{%
102   \markdownRendererImagePrototype}%
```

2.2.3.9 Content Block Renderers The `\markdownRendererContentBlock` macro represents an iA Writer content block. It receives four arguments: the local file or online image filename extension cast to the lower case, the fully escaped URI that can be directly typeset, the raw URI that can be used outside typesetting, and the title of the content block.

```
103 \def\markdownRendererContentBlock{%
104   \markdownRendererContentBlockPrototype}%
```

The `\markdownRendererContentBlockOnlineImage` macro represents an iA Writer online image content block. The macro receives the same arguments as `\markdownRendererContentBlock`.

```
105 \def\markdownRendererContentBlockOnlineImage{%
106   \markdownRendererContentBlockOnlineImagePrototype}%
```

The `\markdownRendererContentBlockCode` macro represents an iA Writer content block that was recognized as a file in a known programming language by its filename extension *s*. If any `markdown-languages.json` file found by kpathsea³ contains a

³Local files take precedence. Filenames other than `markdown-languages.json` may be specified using the `contentBlocksLanguageMap` Lua option.

record (k, v) , then a non-online-image content block with the filename extension s , $s:\text{lower}() = k$ is considered to be in a known programming language v .

The macro receives four arguments: the local file name extension s cast to the lower case, the language v , the fully escaped URI that can be directly typeset, the raw URI that can be used outside typesetting, and the title of the content block.

Note that you will need to place place a `markdown-languages.json` file inside your working directory or inside your local TeX directory structure. In this file, you will define a mapping between filename extensions and the language names recognized by your favorite syntax highlighter; there may exist other creative uses beside syntax highlighting. The `Languages.json` file provided by [2] is a good starting point.

```
107 \def\markdownRendererContentBlockCode{%
108   \markdownRendererContentBlockCodePrototype}%
```

2.2.3.10 Bullet List Renderers The `\markdownRendererUlBegin` macro represents the beginning of a bulleted list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
109 \def\markdownRendererUlBegin{%
110   \markdownRendererUlBeginPrototype}%
```

The `\markdownRendererUlBeginTight` macro represents the beginning of a bulleted list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
111 \def\markdownRendererUlBeginTight{%
112   \markdownRendererUlBeginTightPrototype}%
```

The `\markdownRendererUlItem` macro represents an item in a bulleted list. The macro receives no arguments.

```
113 \def\markdownRendererUlItem{%
114   \markdownRendererUlItemPrototype}%
```

The `\markdownRendererUlItemEnd` macro represents the end of an item in a bulleted list. The macro receives no arguments.

```
115 \def\markdownRendererUlItemEnd{%
116   \markdownRendererUlItemEndPrototype}%
```

The `\markdownRendererUlEnd` macro represents the end of a bulleted list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
117 \def\markdownRendererUlEnd{%
118   \markdownRendererUlEndPrototype}%
```

The `\markdownRendererUlEndTight` macro represents the end of a bulleted list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
119 \def\markdownRendererUlEndTight{%
120   \markdownRendererUlEndTightPrototype}%
```

2.2.3.11 Ordered List Renderers The `\markdownRendererOlBegin` macro represents the beginning of an ordered list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
121 \def\markdownRendererOlBegin{%
122   \markdownRendererOlBeginPrototype}%
```

The `\markdownRendererOlBeginTight` macro represents the beginning of an ordered list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
123 \def\markdownRendererOlBeginTight{%
124   \markdownRendererOlBeginTightPrototype}%
```

The `\markdownRendererOlItem` macro represents an item in an ordered list. This macro will only be produced, when the `startNumber` option is `false`. The macro receives no arguments.

```
125 \def\markdownRendererOlItem{%
126   \markdownRendererOlItemPrototype}%
```

The `\markdownRendererOlItemEnd` macro represents the end of an item in an ordered list. The macro receives no arguments.

```
127 \def\markdownRendererOlItemEnd{%
128   \markdownRendererOlItemEndPrototype}%
```

The `\markdownRendererOlItemWithNumber` macro represents an item in an ordered list. This macro will only be produced, when the `startNumber` option is `true`. The macro receives no arguments.

```
129 \def\markdownRendererOlItemWithNumber{%
130   \markdownRendererOlItemWithNumberPrototype}%
```

The `\markdownRendererOlEnd` macro represents the end of an ordered list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
131 \def\markdownRendererOlEnd{%
132   \markdownRendererOlEndPrototype}%
```

The `\markdownRendererOlEndTight` macro represents the end of an ordered list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
133 \def\markdownRendererOlEndTight{%
134   \markdownRendererOlEndTightPrototype}%
```

2.2.3.12 Definition List Renderers The following macros are only produced, when the `definitionLists` option is `true`.

The `\markdownRendererDlBegin` macro represents the beginning of a definition list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
135 \def\markdownRendererDlBegin{%
136   \markdownRendererDlBeginPrototype}{}
```

The `\markdownRendererDlBeginTight` macro represents the beginning of a definition list that contains an item with several paragraphs of text (the list is not tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
137 \def\markdownRendererDlBeginTight{%
138   \markdownRendererDlBeginTightPrototype}{}
```

The `\markdownRendererDlItem` macro represents a term in a definition list. The macro receives a single argument that corresponds to the term being defined.

```
139 \def\markdownRendererDlItem{%
140   \markdownRendererDlItemPrototype}{}
```

The `\markdownRendererDlItemEnd` macro represents the end of a list of definitions for a single term.

```
141 \def\markdownRendererDlItemEnd{%
142   \markdownRendererDlItemEndPrototype}{}
```

The `\markdownRendererDlDefinitionBegin` macro represents the beginning of a definition in a definition list. There can be several definitions for a single term.

```
143 \def\markdownRendererDlDefinitionBegin{%
144   \markdownRendererDlDefinitionBeginPrototype}{}
```

The `\markdownRendererDlDefinitionEnd` macro represents the end of a definition in a definition list. There can be several definitions for a single term.

```
145 \def\markdownRendererDlDefinitionEnd{%
146   \markdownRendererDlDefinitionEndPrototype}{}
```

The `\markdownRendererDlEnd` macro represents the end of a definition list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
147 \def\markdownRendererDlEnd{%
148   \markdownRendererDlEndPrototype}{}
```

The `\markdownRendererDlEndTight` macro represents the end of a definition list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
149 \def\markdownRendererDlEndTight{%
150   \markdownRendererDlEndTightPrototype}{}
```

2.2.3.13 Emphasis Renderers The `\markdownRendererEmphasis` macro represents an emphasized span of text. The macro receives a single argument that corresponds to the emphasized span of text.

```
151 \def\markdownRendererEmphasis{%
152   \markdownRendererEmphasisPrototype}%
```

The `\markdownRendererStrongEmphasis` macro represents a strongly emphasized span of text. The macro receives a single argument that corresponds to the emphasized span of text.

```
153 \def\markdownRendererStrongEmphasis{%
154   \markdownRendererStrongEmphasisPrototype}%
```

2.2.3.14 Block Quote Renderers The `\markdownRendererBlockQuoteBegin` macro represents the beginning of a block quote. The macro receives no arguments.

```
155 \def\markdownRendererBlockQuoteBegin{%
156   \markdownRendererBlockQuoteBeginPrototype}%
```

The `\markdownRendererBlockQuoteEnd` macro represents the end of a block quote. The macro receives no arguments.

```
157 \def\markdownRendererBlockQuoteEnd{%
158   \markdownRendererBlockQuoteEndPrototype}%
```

2.2.3.15 Code Block Renderers The `\markdownRendererInputVerbatim` macro represents a code block. The macro receives a single argument that corresponds to the filename of a file containing the code block contents.

```
159 \def\markdownRendererInputVerbatim{%
160   \markdownRendererInputVerbatimPrototype}%
```

The `\markdownRendererInputFencedCode` macro represents a fenced code block. This macro will only be produced, when the `fencedCode` option is `true`. The macro receives two arguments that correspond to the filename of a file containing the code block contents and to the code fence infostring.

```
161 \def\markdownRendererInputFencedCode{%
162   \markdownRendererInputFencedCodePrototype}%
```

2.2.3.16 Heading Renderers The `\markdownRendererHeadingOne` macro represents a first level heading. The macro receives a single argument that corresponds to the heading text.

```
163 \def\markdownRendererHeadingOne{%
164   \markdownRendererHeadingOnePrototype}%
```

The `\markdownRendererHeadingTwo` macro represents a second level heading. The macro receives a single argument that corresponds to the heading text.

```
165 \def\markdownRendererHeadingTwo{%
166   \markdownRendererHeadingTwoPrototype}%
```

The `\markdownRendererHeadingThree` macro represents a third level heading. The macro receives a single argument that corresponds to the heading text.

```
167 \def\markdownRendererHeadingThree{%
168   \markdownRendererHeadingThreePrototype}%
```

The `\markdownRendererHeadingFour` macro represents a fourth level heading. The macro receives a single argument that corresponds to the heading text.

```
169 \def\markdownRendererHeadingFour{%
170   \markdownRendererHeadingFourPrototype}%
```

The `\markdownRendererHeadingFive` macro represents a fifth level heading. The macro receives a single argument that corresponds to the heading text.

```
171 \def\markdownRendererHeadingFive{%
172   \markdownRendererHeadingFivePrototype}%
```

The `\markdownRendererHeadingSix` macro represents a sixth level heading. The macro receives a single argument that corresponds to the heading text.

```
173 \def\markdownRendererHeadingSix{%
174   \markdownRendererHeadingSixPrototype}%
```

2.2.3.17 Horizontal Rule Renderer The `\markdownRendererHorizontalRule` macro represents a horizontal rule. The macro receives no arguments.

```
175 \def\markdownRendererHorizontalRule{%
176   \markdownRendererHorizontalRulePrototype}%
```

2.2.3.18 Footnote Renderer The `\markdownRendererFootnote` macro represents a footnote. This macro will only be produced, when the `footnotes` option is `true`. The macro receives a single argument that corresponds to the footnote text.

```
177 \def\markdownRendererFootnote{%
178   \markdownRendererFootnotePrototype}%
```

2.2.3.19 Parenthesized Citations Renderer The `\markdownRendererCite` macro represents a string of one or more parenthetical citations. This macro will only be produced, when the `citations` option is `true`. The macro receives the parameter `{<number of citations>} followed by <suppress author>{<prenote>} {<postnote>} {<name>}` repeated `<number of citations>` times. The `<suppress author>` parameter is either the token `-`, when the author's name is to be suppressed, or `+` otherwise.

```
179 \def\markdownRendererCite{%
180   \markdownRendererCitePrototype}%
```

2.2.3.20 Text Citations Renderer The `\markdownRendererTextCite` macro represents a string of one or more text citations. This macro will only be produced, when

the `citations` option is `true`. The macro receives parameters in the same format as the `\markdownRendererCite` macro.

```
181 \def\markdownRendererTextCite{%
182   \markdownRendererTextCitePrototype}%
```

2.2.4 Token Renderer Prototypes

The following \TeX macros provide definitions for the token renderers (see Section 2.2.3) that have not been redefined by the user. These macros are intended to be redefined by macro package authors who wish to provide sensible default token renderers. They are also redefined by the \LaTeX and \ConTeXt implementations (see sections 3.3 and 3.4).

```

2.2.5 Logging Facilities

The `\markdownInfo`, `\markdownWarning`, and `\markdownError` macros provide access to logging to the rest of the macros. Their first argument specifies the text of the info, warning, or error message.

```

241 \def\markdownInfo#1{}%
242 \def\markdownWarning#1{}%

```

The `\markdownError` macro receives a second argument that provides a help text suggesting a remedy to the error.

```
243 \def\markdownError#1#2{}%
```

You may redefine these macros to redirect and process the info, warning, and error messages.

2.2.6 Miscellanea

The `\markdownMakeOther` macro is used by the package, when a TeX engine that does not support direct Lua access is starting to buffer a text. The plain TeX implementation changes the category code of plain TeX special characters to other, but there may be

other active characters that may break the output. This macro should temporarily change the category of these to *other*.

```
244 \let\markdownMakeOther\relax
```

The `\markdownReadAndConvert` macro implements the `\markdownBegin` macro. The first argument specifies the token sequence that will terminate the markdown input (`\markdownEnd` in the instance of the `\markdownBegin` macro) when the plain TeX special characters have had their category changed to *other*. The second argument specifies the token sequence that will actually be inserted into the document, when the ending token sequence has been found.

```
245 \let\markdownReadAndConvert\relax
```

```
246 \begingroup
```

Locally swap the category code of the backslash symbol (`\`) with the pipe symbol (`|`). This is required in order that all the special symbols in the first argument of the `\markdownReadAndConvert` macro have the category code *other*.

```
247 \catcode`\|=0\catcode`\\=12%
248 \gdef\markdownBegin{%
249   |markdownReadAndConvert{\markdownEnd}%
250   {|\markdownEnd}}%
251 \endgroup
```

The macro is exposed in the interface, so that the user can create their own markdown environments. Due to the way the arguments are passed to Lua (see Section 3.2.6), the first argument may not contain the string `]]` (regardless of the category code of the bracket symbol `]`).

The `\markdownMode` macro specifies how the plain TeX implementation interfaces with the Lua interface. The valid values and their meaning are as follows:

- `0` – Shell escape via the `18` output file stream
- `1` – Shell escape via the Lua `os.execute` method
- `2` – Direct Lua access

By defining the macro, the user can coerce the package to use a specific mode. If the user does not define the macro prior to loading the plain TeX implementation, the correct value will be automatically detected. The outcome of changing the value of `\markdownMode` after the implementation has been loaded is undefined.

```
252 \ifx\markdownMode\undefined
253   \ifx\directlua\undefined
254     \def\markdownMode{0}%
255   \else
256     \def\markdownMode{2}%
257   \fi
258 \fi
```

The following macros are no longer a part of the plain \TeX interface and are only defined for backwards compatibility:

```
259 \def\markdownLuaRegisterIBCallback#1{\relax}%
260 \def\markdownLuaUnregisterIBCallback#1{\relax}%
```

2.3 L^AT_EX Interface

The L^AT_EX interface provides L^AT_EX environments for the typesetting of markdown input from within L^AT_EX, facilities for setting Lua interface options (see Section 2.1.2) used during the conversion from markdown to plain \TeX , and facilities for changing the way markdown tokens are rendered. The rest of the interface is inherited from the plain \TeX interface (see Section 2.2).

The L^AT_EX interface is implemented by the `markdown.sty` file, which can be loaded from the L^AT_EX document preamble as follows:

```
\usepackage[<options>]{markdown}
```

where `<options>` are the L^AT_EX interface options (see Section 2.3.2). Note that `<options>` inside the `\usepackage` macro may not set the `markdownRenderers` (see Section 2.3.2.2) and `markdownRendererPrototypes` (see Section 2.3.2.3) keys. This limitation is due to the way L^AT_EX₂ ε parses package options.

2.3.1 Typesetting Markdown

The interface exposes the `markdown` and `markdown*` L^AT_EX environments, and redefines the `\markdownInput` command.

The `markdown` and `markdown*` L^AT_EX environments are used to typeset markdown document fragments. The starred version of the `markdown` environment accepts L^AT_EX interface options (see Section 2.3.2) as its only argument. These options will only influence this markdown document fragment.

```
261 \newenvironment{markdown}{\relax}{\relax}
262 \newenvironment{markdown*}[1]{\relax}{\relax}
```

You may prepend your own code to the `\markdown` macro and append your own code to the `\endmarkdown` macro to produce special effects before and after the `markdown` L^AT_EX environment (and likewise for the starred version).

Note that the `markdown` and `markdown*` L^AT_EX environments are subject to the same limitations as the `\markdownBegin` and `\markdownEnd` macros exposed by the plain \TeX interface.

The following example L^AT_EX code showcases the usage of the `markdown` and `markdown*` environments:

| | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>\documentclass{article} \usepackage{markdown} \begin{document} % ... \begin{markdown} _Hello_ **world** ... \end{markdown} % ... \end{document}</pre> | <pre>\documentclass{article} \usepackage{markdown} \begin{document} % ... \begin{markdown*}{smartEllipses} _Hello_ **world** ... \end{markdown*} % ... \end{document}</pre> |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The `\markdownInput` macro accepts a single mandatory parameter containing the filename of a markdown document and expands to the result of the conversion of the input markdown document to plain \TeX . Unlike the `\markdownInput` macro provided by the plain \TeX interface, this macro also accepts \LaTeX interface options (see Section 2.3.2) as its optional argument. These options will only influence this markdown document.

The following example \LaTeX code showcases the usage of the `\markdownInput` macro:

```
\documentclass{article}
\usepackage{markdown}
\begin{document}
% ...
\markdownInput[smartEllipses]{hello.md}
% ...
\end{document}
```

2.3.2 Options

The \LaTeX options are represented by a comma-delimited list of $\langle\langle key\rangle\rangle=\langle value\rangle$ pairs. For boolean options, the $\langle value\rangle$ part is optional, and $\langle\langle key\rangle\rangle$ will be interpreted as $\langle\langle key\rangle\rangle=true$.

The \LaTeX options map directly to the options recognized by the plain \TeX interface (see Section 2.2.2) and to the markdown token renderers and their prototypes recognized by the plain \TeX interface (see Sections 2.2.3 and 2.2.4).

The \LaTeX options may be specified when loading the \LaTeX package (see Section 2.3), when using the `markdown*` \LaTeX environment, or via the `\markdownSetup` macro. The `\markdownSetup` macro receives the options to set up as its only argument.

```
263 \newcommand\markdownSetup[1]{%
264   \setkeys{markdownOptions}{#1}}%
```

2.3.2.1 Plain TeX Interface Options The following options map directly to the option macros exposed by the plain TeX interface (see Section 2.2.2).

```
265 \RequirePackage[keyval]
266 \define@key{markdownOptions}{helperScriptFileName}{%
267   \def\markdownOptionHelperScriptFileName{\#1}%
268 \define@key{markdownOptions}{inputTempFileName}{%
269   \def\markdownOptionInputTempFileName{\#1}%
270 \define@key{markdownOptions}{outputTempFileName}{%

295   \def\markdownOptionFootnotes{\#1}%
296 \define@key{markdownOptions}{fencedCode}[true]{%
297   \def\markdownOptionFencedCode{\#1}%
298 \define@key{markdownOptions}{hashEnumerators}[true]{%
299   \def\markdownOptionHashEnumerators{\#1}%
300 \define@key{markdownOptions}{html}[true]{%
301   \def\markdownOptionHtml{\#1}%
302 \define@key{markdownOptions}{hybrid}[true]{%
303   \def\markdownOptionHybrid{\#1}%
304 \define@key{markdownOptions}{inlineFootnotes}[true]{%
305   \def\markdownOptionInlineFootnotes{\#1}%
306 \define@key{markdownOptions}{preserveTabs}[true]{%
307   \def\markdownOptionPreserveTabs{\#1}%
308 \define@key{markdownOptions}{smartEllipses}[true]{%
309   \def\markdownOptionSmartEllipses{\#1}}%
```

```

310 \define@key{markdownOptions}{startNumber}[true]{%
311   \def\markdownOptionStartNumber{\#1}%
312 \define@key{markdownOptions}{tightLists}[true]{%
313   \def\markdownOptionTightLists{\#1}%
314 \define@key{markdownOptions}{underscores}[true]{%
315   \def\markdownOptionUnderscores{\#1}%

```

The following example \LaTeX code showcases a possible configuration of plain \TeX interface options `\markdownOptionHybrid`, `\markdownOptionSmartEllipses`, and `\markdownOptionCacheDir`.

```
\markdownSetup{
    hybrid,
    smartEllipses,
    cacheDir = /tmp,
}
```

2.3.2.2 Plain \TeX Markdown Token Renderers The \LaTeX interface recognizes an option with the `renderers` key, whose value must be a list of options that map directly to the markdown token renderer macros exposed by the plain \TeX interface (see Section 2.2.3).

```

316 \define@key{markdownRenderers}{interblockSeparator}{%
317   \renewcommand\markdownRendererInterblockSeparator{\#1}%
318 \define@key{markdownRenderers}{lineBreak}{%
319   \renewcommand\markdownRendererLineBreak{\#1}%
320 \define@key{markdownRenderers}{ellipsis}{%
321   \renewcommand\markdownRendererEllipsis{\#1}%
322 \define@key{markdownRenderers}{nbsp}{%
323   \renewcommand\markdownRendererNbsp{\#1}%
324 \define@key{markdownRenderers}{leftBrace}{%
325   \renewcommand\markdownRendererLeftBrace{\#1}%
326 \define@key{markdownRenderers}{rightBrace}{%
327   \renewcommand\markdownRendererRightBrace{\#1}%
328 \define@key{markdownRenderers}{dollarSign}{%
329   \renewcommand\markdownRendererDollarSign{\#1}%
330 \define@key{markdownRenderers}{percentSign}{%
331   \renewcommand\markdownRendererPercentSign{\#1}%

545   \renewcommand\markdownRendererCitePrototype[1]{\#1}%
546 \define@key{markdownRendererPrototypes}{textCite}{%
547   \renewcommand\markdownRendererTextCitePrototype[1]{\#1}}%

```

The following example `LATEX` code showcases a possible configuration of the `\markdownRendererImagePrototype` and `\markdownRendererCodeSpanPrototype` markdown token renderer prototypes.

```

\markdownSetup{
  rendererPrototypes = {
    image = {\includegraphics{\#2}},
    codeSpan = {\texttt{\#1}},    % Render inline code via '\texttt'.
}

```

```
}
```

2.4 ConTeXt Interface

The ConTeXt interface provides a start-stop macro pair for the typesetting of markdown input from within ConTeXt. The rest of the interface is inherited from the plain TeX interface (see Section 2.2).

```
548 \writestatus{loading}{ConTeXt User Module / markdown}%
549 \unprotect
```

The ConTeXt interface is implemented by the `t-markdown.tex` ConTeXt module file that can be loaded as follows:

```
\usemodule[t][markdown]
```

It is expected that the special plain TeX characters have the expected category codes, when `\input`ting the file.

2.4.1 Typesetting Markdown

The interface exposes the `\startmarkdown` and `\stopmarkdown` macro pair for the typesetting of a markdown document fragment.

```
550 \let\startmarkdown\relax
551 \let\stopmarkdown\relax
```

You may prepend your own code to the `\startmarkdown` macro and redefine the `\stopmarkdown` macro to produce special effects before and after the markdown block.

Note that the `\startmarkdown` and `\stopmarkdown` macros are subject to the same limitations as the `\markdownBegin` and `\markdownEnd` macros exposed by the plain TeX interface.

The following example ConTeXt code showcases the usage of the `\startmarkdown` and `\stopmarkdown` macros:

```
\usemodule[t][markdown]
\starttext
\startmarkdown
_Hello_ **world** ...
\stopmarkdown
\stoptext
```

3 Technical Documentation

This part of the manual describes the implementation of the interfaces exposed by the package (see Section 2) and is aimed at the developers of the package, as well as the curious users.

3.1 Lua Implementation

The Lua implementation implements `writer` and `reader` objects that provide the conversion from markdown to plain `TEX`.

The Lunamark Lua module implements writers for the conversion to various other formats, such as DocBook, Groff, or HTML. These were stripped from the module and the remaining markdown reader and plain `TEX` writer were hidden behind the converter functions exposed by the Lua interface (see Section 2.1).

```
552 local upper, gsub, format, length =
553   string.upper, string.gsub, string.format, string.len
554 local concat = table.concat
555 local P, R, S, V, C, Cg, Cb, Cmt, Cc, Ct, B, Cs, any =
556   lpeg.P, lpeg.R, lpeg.S, lpeg.V, lpeg.C, lpeg.Cg, lpeg.Cb,
557   lpeg.Cmt, lpeg.Cc, lpeg.Ct, lpeg.B, lpeg.Cs, lpeg.P(1)
```

3.1.1 Utility Functions

This section documents the utility functions used by the plain `TEX` writer and the markdown reader. These functions are encapsulated in the `util` object. The functions were originally located in the `lunamark/util.lua` file in the Lunamark Lua module.

```
558 local util = {}
```

The `util.err` method prints an error message `msg` and exits. If `exit_code` is provided, it specifies the exit code. Otherwise, the exit code will be 1.

```
559 function util.err(msg, exit_code)
560   io.stderr:write("markdown.lua: " .. msg .. "\n")
561   os.exit(exit_code or 1)
562 end
```

The `util.cache` method computes the digest of `string` and `salt`, adds the `suffix` and looks into the directory `dir`, whether a file with such a name exists. If it does not, it gets created with `transform(string)` as its content. The filename is then returned.

```
563 function util.cache(dir, string, salt, transform, suffix)
564   local digest = md5.sumhexa(string .. (salt or ""))
565   local name = util.pathname(dir, digest .. suffix)
566   local file = io.open(name, "r")
567   if file == nil then -- If no cache entry exists, then create a new one.
568     local file = assert(io.open(name, "w"))
```

```

569     local result = string
570     if transform ~= nil then
571         result = transform(result)
572     end
573     assert(file:write(result))
574     assert(file:close())
575   end
576   return name
577 end

```

The `util.table_copy` method creates a shallow copy of a table `t` and its metatable.

```

578 function util.table_copy(t)
579   local u = { }
580   for k, v in pairs(t) do u[k] = v end
581   return setmetatable(u, getmetatable(t))
582 end

```

The `util.expand_tabs_in_line` expands tabs in string `s`. If `tabstop` is specified, it is used as the tab stop width. Otherwise, the tab stop width of 4 characters is used. The method is a copy of the tab expansion algorithm from [4, Chapter 21].

```

583 function util.expand_tabs_in_line(s, tabstop)
584   local tab = tabstop or 4
585   local corr = 0
586   return (s:gsub("()\t", function(p)
587       local sp = tab - (p - 1 + corr) % tab
588       corr = corr - 1 + sp
589       return string.rep(" ", sp)
590   end))
591 end

```

The `util.walk` method walks a rope `t`, applying a function `f` to each leaf element in order. A rope is an array whose elements may be ropes, strings, numbers, or functions. If a leaf element is a function, call it and get the return value before proceeding.

```

592 function util.walk(t, f)
593   local typ = type(t)
594   if typ == "string" then
595     f(t)
596   elseif typ == "table" then
597     local i = 1
598     local n
599     n = t[i]
600     while n do
601       util.walk(n, f)
602       i = i + 1
603       n = t[i]
604     end
605   elseif typ == "function" then

```

```

606     local ok, val = pcall(t)
607     if ok then
608         util.walk(val,f)
609     end
610   else
611     f(tostring(t))
612   end
613 end

```

The `util.flatten` method flattens an array `ary` that does not contain cycles and returns the result.

```

614 function util.flatten(ary)
615   local new = {}
616   for _,v in ipairs(ary) do
617     if type(v) == "table" then
618       for _,w in ipairs(util.flatten(v)) do
619         new[#new + 1] = w
620       end
621     else
622       new[#new + 1] = v
623     end
624   end
625   return new
626 end

```

The `util.rope_to_string` method converts a rope `rope` to a string and returns it. For the definition of a rope, see the definition of the `util.walk` method.

```

627 function util.rope_to_string(rope)
628   local buffer = {}
629   util.walk(rope, function(x) buffer[#buffer + 1] = x end)
630   return table.concat(buffer)
631 end

```

The `util.rope_last` method retrieves the last item in a rope. For the definition of a rope, see the definition of the `util.walk` method.

```

632 function util.rope_last(rope)
633   if #rope == 0 then
634     return nil
635   else
636     local l = rope[#rope]
637     if type(l) == "table" then
638       return util.rope_last(l)
639     else
640       return l
641     end
642   end
643 end

```

Given an array `ary` and a string `x`, the `util.intersperse` method returns an array `new`, such that `ary[i] == new[2*(i-1)+1]` and `new[2*i] == x` for all $1 \leq i \leq \#ary$.

```
644 function util.intersperse(ary, x)
645   local new = {}
646   local l = #ary
647   for i,v in ipairs(ary) do
648     local n = #new
649     new[n + 1] = v
650     if i ~= l then
651       new[n + 2] = x
652     end
653   end
654   return new
655 end
```

Given an array `ary` and a function `f`, the `util.map` method returns an array `new`, such that `new[i] == f(ary[i])` for all $1 \leq i \leq \#ary$.

```
656 function util.map(ary, f)
657   local new = {}
658   for i,v in ipairs(ary) do
659     new[i] = f(v)
660   end
661   return new
662 end
```

Given a table `char_escapes` mapping escapable characters to escaped strings and optionally a table `string_escapes` mapping escapable strings to escaped strings, the `util.escaper` method returns an escaper function that escapes all occurrences of escapable strings and characters (in this order).

The method uses LPeg, which is faster than the Lua `string.gsub` built-in method.

```
663 function util.escaper(char_escapes, string_escapes)
```

Build a string of escapable characters.

```
664   local char_escapes_list = ""
665   for i,_ in pairs(char_escapes) do
666     char_escapes_list = char_escapes_list .. i
667   end
```

Create an LPeg capture `escapable` that produces the escaped string corresponding to the matched escapable character.

```
668   local escapable = S(char_escapes_list) / char_escapes
```

If `string_escapes` is provided, turn `escapable` into the

$$\sum_{(k,v) \in \text{string_escapes}} P(k) / v + \text{escapable}$$

capture that replaces any occurrence of the string `k` with the string `v` for each $(k, v) \in \text{string_escapes}$. Note that the pattern summation is not commutative and its operands are inspected in the summation order during the matching. As a corollary, the strings always take precedence over the characters.

```
669 if string_escapes then
670   for k,v in pairs(string_escapes) do
671     escapable = P(k) / v + escapable
672   end
673 end
```

Create an LPeg capture `escape_string` that captures anything `escapable` does and matches any other unmatched characters.

```
674 local escape_string = Cs((escapable + any)^0)
```

Return a function that matches the input string `s` against the `escape_string` capture.

```
675 return function(s)
676   return lpeg.match(escape_string, s)
677 end
678 end
```

The `util.pathname` method produces a pathname out of a directory name `dir` and a filename `file` and returns it.

```
679 function util.pathname(dir, file)
680   if #dir == 0 then
681     return file
682   else
683     return dir .. "/" .. file
684   end
685 end
```

3.1.2 HTML Entities

This section documents the HTML entities recognized by the markdown reader. These functions are encapsulated in the `entities` object. The functions were originally located in the `lunamark/entities.lua` file in the Lunamark Lua module.

```
686 local entities = {}
687
688 local character_entities = {

```

Given a string `s` of decimal digits, the `entities.dec_entity` returns the corresponding UTF8-encoded Unicode codepoint.

```

939 function entities.dec_entity(s)
940   return unicode.utf8.char(tonumber(s))
941 end

```

Given a string `s` of hexadecimal digits, the `entities.hex_entity` returns the corresponding UTF8-encoded Unicode codepoint.

```

942 function entities.hex_entity(s)
943   return unicode.utf8.char(tonumber("0x"..s))
944 end

```

Given a character entity name `s` (like `ouml`), the `entities.char_entity` returns the corresponding UTF8-encoded Unicode codepoint.

```

945 function entities.char_entity(s)
946   local n = character_entities[s]
947   return unicode.utf8.char(n)
948 end

```

3.1.3 Plain \TeX Writer

This section documents the `writer` object, which implements the routines for producing the \TeX output. The object is an amalgamate of the generic, \TeX , \LaTeX writer objects that were located in the `lunamark/writer/generic.lua`, `lunamark/writer/tex.lua`, and `lunamark/writer/latex.lua` files in the Lunamark Lua module.

Although not specified in the Lua interface (see Section 2.1), the `writer` object is exported, so that the curious user could easily tinker with the methods of the objects produced by the `writer.new` method described below. The user should be aware, however, that the implementation may change in a future revision.

```
949 M.writer = {}
```

The `writer.new` method creates and returns a new \TeX writer object associated with the Lua interface options (see Section 2.1.2) `options`. When `options` are unspecified, it is assumed that an empty table was passed to the method.

The objects produced by the `writer.new` method expose instance methods and variables of their own. As a convention, I will refer to these `<member>`s as `writer-><member>`.

```
950 function M.writer.new(options)
```

```

951 local self = {}
952 options = options or {}
      Make the options table inherit from the defaultOptions table.
953 setmetatable(options, { __index = function (_, key)
954     return defaultOptions[key] end })
      Define writer->suffix as the suffix of the produced cache files.
955 self.suffix = ".tex"
      Define writer->space as the output format of a space character.
956 self.space = " "
      Define writer->nbspace as the output format of a non-breaking space character.
957 self.nbsp = "\\\markdownRendererNnbsp{}"
      Define writer->plain as a function that will transform an input plain text block s
      to the output format.
958 function self/plain(s)
959     return s
960 end
      Define writer->paragraph as a function that will transform an input paragraph s
      to the output format.
961 function self/paragraph(s)
962     return s
963 end
      Define writer->pack as a function that will take the filename name of the output
      file prepared by the reader and transform it to the output format.
964 function self/pack(name)
965     return [[\input]] .. name .. [[\"relax]]
966 end
      Define writer->interblocksep as the output format of a block element separator.
967 self.interblocksep = "\\\markdownRendererInterblockSeparator\n{}"
      Define writer->eof as the end of file marker in the output format.
968 self.eof = [[\relax]]
      Define writer->linebreak as the output format of a forced line break.
969 self.linebreak = "\\\markdownRendererLineBreak\n{}"
      Define writer->ellipsis as the output format of an ellipsis.
970 self.ellipsis = "\\\markdownRendererEllipsis{}"
      Define writer->hrule as the output format of a horizontal rule.
971 self.hrule = "\\\markdownRendererHorizontalRule{}"

```

Define a table `escaped_chars` containing the mapping from special plain TeX characters (including the active pipe character (`\|`) of ConTeXt) to their escaped variants. Define tables `escaped_minimal_chars` and `escaped_minimal_strings` containing the mapping from special plain characters and character strings that need to be escaped even in content that will not be typeset.

```

972 local escaped_chars = {
973     ["{"] = "\\\markdownRendererLeftBrace{}",
974     ["}"] = "\\\markdownRendererRightBrace{}",
975     ["$"] = "\\\markdownRendererDollarSign{}",
976     ["%"] = "\\\markdownRendererPercentSign{}",
977     ["&"] = "\\\markdownRendererAmpersand{}",
978     ["_"] = "\\\markdownRendererUnderscore{}",
979     ["#"] = "\\\markdownRendererHash{}",
980     ["^"] = "\\\markdownRendererCircumflex{}",
981     ["\\"] = "\\\markdownRendererBackslash{}",
982     ["~"] = "\\\markdownRendererTilde{}",
983     ["|"] = "\\\markdownRendererPipe{}",
984 }
984 local escaped_minimal_chars = {
985     ["{"] = "\\\markdownRendererLeftBrace{}",
986     ["}"] = "\\\markdownRendererRightBrace{}",
987     ["%"] = "\\\markdownRendererPercentSign{}",
988     ["\\"] = "\\\markdownRendererBackslash{}",
989 }
989 local escaped_minimal_strings = {
990     ["^^"] = "\\\markdownRendererCircumflex\\\\markdownRendererCircumflex",

```

Use the `escaped_chars` table to create an escaper function `escape` and the `escaped_minimal_chars` and `escaped_minimal_strings` tables to create an escaper function `escape_minimal`.

```

991 local escape = util.escaper(escaped_chars)
992 local escape_minimal = util.escaper(escaped_minimal_chars,
993     escaped_minimal_strings)

```

Define `writer->string` as a function that will transform an input plain text span `s` to the output format and `writer->uri` as a function that will transform an input URI `u` to the output format. If the `hybrid` option is `true`, use identity functions. Otherwise, use the `escape` and `escape_minimal` functions.

```

994 if options.hybrid then
995     self.string = function(s) return s end
996     self.uri = function(u) return u end
997 else
998     self.string = escape
999     self.uri = escape_minimal
1000 end

```

Define `writer->code` as a function that will transform an input inlined code span `s` to the output format.

```
1001 function self.code(s)
```

```
1002     return {"\\markdownRendererCodeSpan{" , escape(s) , "}"}
1003 end
```

Define `writer->link` as a function that will transform an input hyperlink to the output format, where `lab` corresponds to the label, `src` to URI, and `tit` to the title of the link.

```
1004 function self.link(lab,src,tit)
1005     return {"\\markdownRendererLink{" , lab , "}",
1006             "{" , self.string(src) , "}" ,
1007             "{" , self.uri(src) , "}" ,
1008             "{" , self.string(tit or "") , "}" }
1009 end
```

Define `writer->image` as a function that will transform an input image to the output format, where `lab` corresponds to the label, `src` to the URL, and `tit` to the title of the image.

```
1010 function self.image(lab,src,tit)
1011     return {"\\markdownRendererImage{" , lab , "}",
1012             "{" , self.string(src) , "}" ,
1013             "{" , self.uri(src) , "}" ,
1014             "{" , self.string(tit or "") , "}" }
1015 end
```

The `languages_json` table maps programming language filename extensions to fence infostrings. All `options.contentBlocksLanguageMap` files located by kpathsea are loaded into a chain of tables. `languages_json` corresponds to the first table and is chained with the rest via Lua metatables.

```
1016 local languages_json = (function()
1017     local kpse = require('kpse')
1018     kpse.set_program_name('luatex')
1019     local base, prev, curr
1020     for _, file in ipairs[kpse.lookup(options.contentBlocksLanguageMap,
1021                                         { all=true })} do
1022         json = assert(io.open(file, "r")):read("*all")
1023                     :gsub('(^\\n)-'):' , [%1] = ')
1024         curr = (function()
1025             local _ENV={ json=json, load=load } -- run in sandbox
1026             return load("return ..json")()
1027         end]()
1028         if type(curr) == "table" then
1029             if base == nil then
1030                 base = curr
1031             else
1032                 setmetatable(prev, { __index = curr })
1033             end
1034             prev = curr
1035         end
```

```

1036   end
1037   return base or {}
1038 end)()

```

Define `writer->contentblock` as a function that will transform an input iA Writer content block to the output format, where `src` corresponds to the URI prefix, `suf` to the URI extension, `type` to the type of the content block (`localfile` or `onlineimage`), and `tit` to the title of the content block.

```

1039   function self.contentblock(src,suf,type,tit)
1040     src = src.."."..suf
1041     suf = suf:lower()
1042     if type == "onlineimage" then
1043       return {"\\markdownRendererContentBlockOnlineImage{" ,suf ,"}",
1044               {" ,self.string(src),"}",
1045               {" ,self.uri(src),"}",
1046               {" ,self.string(tit or ""),"}"}

3.1.5 Markdown Reader

This section documents the `reader` object, which implements the routines for parsing the markdown input. The object corresponds to the markdown reader object that was located in the `lunamark/reader/markdown.lua` file in the Lunamark Lua module.

Although not specified in the Lua interface (see Section 2.1), the `reader` object is exported, so that the curious user could easily tinker with the methods of the objects produced by the `reader.new` method described below. The user should be aware, however, that the implementation may change in a future revision.

The `reader.new` method creates and returns a new TeX reader object associated with the Lua interface options (see Section 2.1.2) `options` and with a writer object `writer`. When `options` are unspecified, it is assumed that an empty table was passed to the method.

The objects produced by the `reader.new` method expose instance methods and variables of their own. As a convention, I will refer to these `<member>`s as `reader-><member>`.

```
1687 M.reader = {}
1688 function M.reader.new(writer, options)
1689   local self = {}
1690   options = options or {}
```

Make the `options` table inherit from the `defaultOptions` table.

```
1691   setmetatable(options, { __index = function (_, key)
1692     return defaultOptions[key] end })
```

3.1.5.1 Top-Level Helper Functions Define `normalize_tag` as a function that normalizes a markdown reference tag by lowercasing it, and by collapsing any adjacent whitespace characters.

```
1693 local function normalize_tag(tag)
1694   return unicode.utf8.lower(
1695     gsub(util.rope_to_string(tag), "[ \n\r\t]+", " "))
1696 end
```

Define `expandtabs` either as an identity function, when the `preserveTabs` Lua interface option is `true`, or to a function that expands tabs into spaces otherwise.

```
1697 local expandtabs
1698 if options.preserveTabs then
1699   expandtabs = function(s) return s end
1700 else
1701   expandtabs = function(s)
1702     if s:find("\t") then
1703       return s:gsub("[^\n]*", util.expand_tabs_in_line)
```

```

1704         else
1705             return s
1706         end
1707     end
1708 end

```

The `larsers` (as in “local `parsers`”) hash table stores PEG patterns that depend on the received `options`, which impedes their reuse between different `reader` objects.

```

1709 local larsers = {}

```

3.1.5.2 Top-Level Parser Functions

```

1710 local function create_parser(name, grammar)
1711     return function(str)

```

3.1.5.14 Exported Conversion Function Define `reader->convert` as a function that converts markdown string `input` into a plain TeX output and returns it. Note that the converter assumes that the input has UNIX line endings.

```

2338 function self.convert(input)
2339   references = {}

```

When determining the name of the cache file, create salt for the hashing function out of the package version and the passed options recognized by the Lua interface (see Section 2.1.2). The `cacheDir` option is disregarded.

```

2340   local opt_string = {}
2341   for k,_ in pairs(defaultOptions) do
2342     local v = options[k]
2343     if k ~= "cacheDir" then
2344       opt_string[#opt_string+1] = k .. "=" .. tostring(v)
2345     end
2346   end
2347   table.sort(opt_string)
2348   local salt = table.concat(opt_string, ",") .. "," .. metadata.version

```

Produce the cache file, transform its filename via the `writer->pack` method, and return the result.

```

2349   local name = util.cache(options.cacheDir, input, salt, function(input)
2350     return util.rope_to_string(parse_blocks_toplevel(input)) .. writer.eof
2351   end, ".md" .. writer.suffix)
2352   return writer.pack(name)
2353 end
2354 return self
2355 end

```

3.1.6 Conversion from Markdown to Plain \TeX

The `new` method returns the `reader->convert` function of a reader object associated with the Lua interface options (see Section 2.1.2) `options` and with a writer object associated with `options`.

```
2356 function M.new(options)
2357   local writer = M.writer.new(options)
2358   local reader = M.reader.new(writer, options)
2359   return reader.convert
2360 end
2361
2362 return M
```

3.2 Plain \TeX Implementation

The plain \TeX implementation provides macros for the interfacing between \TeX and Lua and for the buffering of input text. These macros are then used to implement the macros for the conversion from markdown to plain \TeX exposed by the plain \TeX interface (see Section 2.2).

2500 \fi
2501 }%

```

The `\markdownPrepare` macro contains the Lua code that is executed prior to any conversion from markdown to plain TeX. It exposes the `convert` function for the use by any further Lua code.

```
2502 \def\markdownPrepare{%
```

First, ensure that the `\markdownOptionCacheDir` directory exists.

```

2503 local lfs = require("lfs")
2504 local cacheDir = "\markdownOptionCacheDir"
2505 if lfs.isdir(cacheDir) == true then else
2506   assert(lfs.mkdir(cacheDir))
2507 end

```

Next, load the `markdown` module and create a converter function using the plain TeX options, which were serialized to a Lua table via the `\markdownLuaOptions` macro.

```

2508 local md = require("markdown")
2509 local convert = md.new(\markdownLuaOptions)

```

```
2510 }%
```

3.2.4 Buffering Markdown Input

The macro `\markdownLuaExecuteFileStream` contains the number of the output file stream that will be used to store the helper Lua script in the file named `\markdownOptionHelperScriptFileName` during the expansion of the macro `\markdownLuaExecute` when the Lua shell escape bridge is in use, and to store the markdown input in the file named `\markdownOptionInputTempFileName` during the expansion of the macro `\markdownReadAndConvert`.

```
2511 \csname newwrite\endcsname\markdownLuaExecuteFileStream
```

The `\markdownReadAndConvertTab` macro contains the tab character literal.

```
2512 \begingroup
2513   \catcode`\\=12%
2514   \gdef\markdownReadAndConvertTab{``}%
2515 \endgroup
```

The `\markdownReadAndConvert` macro is largely a rewrite of the $\text{\LaTeX}_2\varepsilon$ `\filecontents` macro to plain \TeX .

```
2516 \begingroup
```

Make the newline and tab characters active and swap the character codes of the backslash symbol (`\`) and the pipe symbol (`|`), so that we can use the backslash as an ordinary character inside the macro definition.

```
2517 \catcode`\\=13%
2518 \catcode`\\=13%
2519 \catcode`|=0%
2520 \catcode`\\=12%
2521 \gdef|\markdownReadAndConvert#1#2{%
2522   \begingroup%
```

Open the `\markdownOptionInputTempFileName` file for writing.

```
2523 |immediate|openout|\markdownLuaExecuteFileStream%
2524   |\markdownOptionInputTempFileName%
2525   |markdownInfo{Buffering markdown input into the temporary %
2526     input file "|markdownOptionInputTempFileName" and scanning %
2527     for the closing token sequence "#1"}%
```

Locally change the category of the special plain \TeX characters to *other* in order to prevent unwanted interpretation of the input. Change also the category of the space character, so that we can retrieve it unaltered.

```
2528 \def|do##1{|catcode`##1=12}|dospecials%
2529   |catcode` |=12%
2530   |\markdownMakeOther%
```

The `\markdownReadAndConvertProcessLine` macro will process the individual lines of output. Note the use of the comments to ensure that the entire macro is at a single line and therefore no (active) newline symbols are produced.

```
2531 |def |markdownReadAndConvertProcessLine##1#1##2#1##3|relax{%
```

When the ending token sequence does not appear in the line, store the line in the `\markdownOptionInputTempFileName` file.

```
2532 |ifx|relax##3|relax%
2533     |immediate|write|markdownLuaExecuteFileStream{##1}%
2534     |else%
```

When the ending token sequence appears in the line, make the next newline character close the `\markdownOptionInputTempFileName` file, return the character categories back to the former state, convert the `\markdownOptionInputTempFileName` file from markdown to plain T_EX, `\input` the result of the conversion, and expand the ending control sequence.

```
2535 |def^~M{%
2536     |markdownInfo{The ending token sequence was found}%
2537     |immediate|closeout|markdownLuaExecuteFileStream%
2538     |endgroup%
2539     |markdownInput|\markdownOptionInputTempFileName%
2540     #2}%
2541 |fi%
```

Repeat with the next line.

```
2542     ^~M}%
```

Make the tab character active at expansion time and make it expand to a literal tab character.

```
2543 |catcode`|^^I=13%
2544 |def^^I{|markdownReadAndConvertTab}%
```

Make the newline character active at expansion time and make it consume the rest of the line on expansion. Throw away the rest of the first line and pass the second line to the `\markdownReadAndConvertProcessLine` macro.

```
2545 |catcode`|^^M=13%
2546 |def^~M##1^~M{%
2547     |def^~M####1^~M{%
2548         |markdownReadAndConvertProcessLine####1#1#1|relax}%
2549     ^~M}%
2550     ^~M}%
```

Reset the character categories back to the former state.

```
2551 |endgroup
```

3.2.5 Lua Shell Escape Bridge

The following \TeX code is intended for \TeX engines that do not provide direct access to Lua, but expose the shell of the operating system. This corresponds to the `\markdownMode` values of 0 and 1.

The `\markdownLuaExecute` macro defined here and in Section 3.2.6 are meant to be indistinguishable to the remaining code.

The package assumes that although the user is not using the $\text{Lua}\text{\TeX}$ engine, their \TeX distribution contains it, and uses shell access to produce and execute Lua scripts using the $\text{\TeX}\text{Lua}$ interpreter (see [1, Section 3.1.1]).

```
2552 \ifnum\markdownMode<2\relax
2553 \ifnum\markdownMode=0\relax
2554   \markdownInfo{Using mode 0: Shell escape via write18}%
2555 \else
2556   \markdownInfo{Using mode 1: Shell escape via os.execute}%
2557 \fi
```

The `\markdownExecuteShellEscape` macro contains the numeric value indicating whether the shell access is enabled (1), disabled (0), or restricted (2).

Inherit the value of the the `\pdfshellescape` ($\text{Lua}\text{\TeX}$, $\text{Pdft}\text{\TeX}$) or the `\shellescape` ($\text{X}\text{\TeX}$) commands. If neither of these commands is defined and Lua is available, attempt to access the `status.shell_escape` configuration item.

If you cannot detect, whether the shell access is enabled, act as if it were.

```
2558 \ifx\pdfshellescape\undefined
2559   \ifx\shellescape\undefined
2560     \ifnum\markdownMode=0\relax
2561       \def\markdownExecuteShellEscape{1}%
2562     \else
2563       \def\markdownExecuteShellEscape{%
2564         \directlua{tex.sprint(status.shell_escape or "1")}%
2565     \fi
2566   \else
2567     \let\markdownExecuteShellEscape\shellescape
2568   \fi
2569 \else
2570   \let\markdownExecuteShellEscape\pdfshellescape
2571 \fi
```

The `\markdownExecuteDirect` macro executes the code it has received as its first argument by writing it to the output file stream 18, if Lua is unavailable, or by using the Lua `os.execute` method otherwise.

```
2572 \ifnum\markdownMode=0\relax
2573   \def\markdownExecuteDirect#1{\immediate\write18{\#1}}%
2574 \else
2575   \def\markdownExecuteDirect#1{%
2576     \directlua{os.execute("\luascapestring{\#1}")}%
2577   }
```

```
2577 \fi
```

The `\markdownExecute` macro is a wrapper on top of `\markdownExecuteDirect` that checks the value of `\markdownExecuteShellEscape` and prints an error message if the shell is inaccessible.

```
2578 \def\markdownExecute#1{%
2579   \ifnum\markdownExecuteShellEscape=1\relax
2580     \markdownExecuteDirect{#1}%
2581   \else
2582     \markdownError{I can not access the shell}{Either run the TeX
2583       compiler with the --shell-escape or the --enable-write18 flag,
2584       or set shell_escape=t in the texmf.cnf file}%
2585   \fi}%

```

The `\markdownLuaExecute` macro executes the Lua code it has received as its first argument. The Lua code may not directly interact with the \TeX engine, but it can use the `print` function in the same manner it would use the `tex.print` method.

```
2586 \def\markdownLuaExecute#1{%
```

Create the file `\markdownOptionHelperScriptFileName` and fill it with the input Lua code prepended with kpathsea initialization, so that Lua modules from the \TeX distribution are available.

```
2587 \immediate\openout\markdownLuaExecuteFileStream=%
2588   \markdownOptionHelperScriptFileName
2589 \markdownInfo{Writing a helper Lua script to the file
2590   "\markdownOptionHelperScriptFileName"}%
2591 \immediate\write\markdownLuaExecuteFileStream{%
2592   local kpse = require('kpse')
2593   kpse.set_program_name('luatex') #1}%
2594 \immediate\closeout\markdownLuaExecuteFileStream
```

Execute the generated `\markdownOptionHelperScriptFileName` Lua script using the $\text{\TeX}\text{Lua}$ binary and store the output in the `\markdownOptionOutputTempFileName` file.

```
2595 \markdownInfo{Executing a helper Lua script from the file
2596   "\markdownOptionHelperScriptFileName" and storing the result in the
2597   file "\markdownOptionOutputTempFileName"}%
2598 \markdownExecute{texlua "\markdownOptionHelperScriptFileName" >
2599   "\markdownOptionOutputTempFileName"}%
\input the generated \markdownOptionOutputTempFileName file.
2600 \input\markdownOptionOutputTempFileName\relax}%

```

3.2.6 Direct Lua Access

The following \TeX code is intended for \TeX engines that provide direct access to Lua ($\text{Lua}\text{\TeX}$). The macro `\markdownLuaExecute` defined here and in Section 3.2.5

are meant to be indistinguishable to the remaining code. This corresponds to the `\markdownMode` value of 2.

```
2601 \else
2602 \markdownInfo{Using mode 2: Direct Lua access}%
```

The direct Lua access version of the `\markdownLuaExecute` macro is defined in terms of the `\directlua` primitive. The `print` function is set as an alias to the `\tex.print` method in order to mimic the behaviour of the `\markdownLuaExecute` definition from Section 3.2.5,

```
2603 \def\markdownLuaExecute#1{\directlua{local print = tex.print #1}}%
2604 \fi
```

3.2.7 Typesetting Markdown

The `\markdownInput` macro uses an implementation of the `\markdownLuaExecute` macro to convert the contents of the file whose filename it has received as its single argument from markdown to plain T_EX.

```
2605 \begingroup
```

Swap the category code of the backslash symbol and the pipe symbol, so that we may use the backslash symbol freely inside the Lua code.

```
2606 \catcode`\|=0%
2607 \catcode`\|=12%
2608 \gdef\markdownInput#1{%
2609   \markdownInfo{Including markdown document "#1"}%
2610   \markdownLuaExecute{%
2611     \markdownPrepare
2612     local input = assert(io.open("#1","r")):read("*a")}
```

Since the Lua converter expects UNIX line endings, normalize the input.

```
2613   print(convert(input:gsub("\r\n?", "\n")))}%
2614 \endgroup
```

3.3 L_AT_EX Implementation

The L_AT_EX implemenation makes use of the fact that, apart from some subtle differences, L_AT_EX implements the majority of the plain T_EX format (see [5, Section 9]). As a consequence, we can directly reuse the existing plain T_EX implementation.

```
2615 \input markdown
2616 \def\markdownVersionSpace{ }%
2617 \ProvidesPackage{markdown}{[\mkern-1mu\overline{\mkern-1mu\text{lastModified}\mkern-1mu}\mkern-1mu]\mkern-1mu\overline{\mkern-1mu\text{version}\mkern-1mu}\mkern-1mu] v%
2618 \mkern-1mu\overline{\mkern-1mu\text{version}\mkern-1mu}\mkern-1mu\overline{\mkern-1mu\text{renderer}\mkern-1mu}\mkern-1mu]%
```

3.3.1 Logging Facilities

The \LaTeX implementation redefines the plain \TeX logging macros (see Section 3.2.1) to use the \LaTeX `\PackageInfo`, `\PackageWarning`, and `\PackageError` macros.

```
2619 \renewcommand\markdownInfo[1]{\PackageInfo{markdown}{#1}}%
2620 \renewcommand\markdownWarning[1]{\PackageWarning{markdown}{#1}}%
2621 \renewcommand\markdownError[2]{\PackageError{markdown}{#1}{#2.}}%
```

3.3.2 Typesetting Markdown

The `\markdownInputPlainTeX` macro is used to store the original plain \TeX implementation of the `\markdownInput` macro. The `\markdownInput` is then redefined to accept an optional argument with options recognized by the \LaTeX interface (see Section 2.3.2).

```
2622 \let\markdownInputPlainTeX\markdownInput
2623 \renewcommand\markdownInput[2][]{%
2624   \begingroup
2625     \markdownSetup{#1}%
2626     \markdownInputPlainTeX{#2}%
2627   \endgroup}
```

The `markdown`, and `markdown*` \LaTeX environments are implemented using the `\markdownReadAndConvert` macro.

```
2628 \renewenvironment{markdown}{%
2629   \markdownReadAndConvert@markdown{}\relax
2630 \renewenvironment{markdown*}[1]{%
2631   \markdownSetup{#1}%
2632   \markdownReadAndConvert@markdown*}\relax
2633 \begingroup
```

Locally swap the category code of the backslash symbol with the pipe symbol, and of the left (`{`) and right brace (`}`) with the less-than (`<`) and greater-than (`>`) signs. This is required in order that all the special symbols that appear in the first argument of the `\markdownReadAndConvert` macro have the category code *other*.

```
2634 \catcode`\|=0\catcode`\<=1\catcode`\>=2%
2635 \catcode`\\=12\catcode`{|=12\catcode`|}=12%
2636 \gdef\markdownReadAndConvert@markdown#1<%
2637   \markdownReadAndConvert<\end{markdown#1}>%
2638   <|end<markdown#1>>>%
2639 \endgroup
```

3.3.3 Options

The supplied package options are processed using the `\markdownSetup` macro.

```
2640 \DeclareOption*{%
2641   \expandafter\markdownSetup\expandafter{\CurrentOption}}%
```

```

2642 \ProcessOptions\relax
2643 \define@key{markdownOptions}{renderers}{%
2644   \setkeys{markdownRenderers}{#1}%
2645   \def\KV@prefix{KV@markdownOptions@}%
2646 \define@key{markdownOptions}{rendererPrototypes}{%
2647   \setkeys{markdownRendererPrototypes}{#1}%
2648   \def\KV@prefix{KV@markdownOptions@}%

```

3.3.4 Token Renderer Prototypes

The following configuration should be considered placeholder.

```

2649 \RequirePackage{url}
2650 \RequirePackage{graphicx}

```

If the `\markdownOptionTightLists` macro expands to `false`, do not load the paralist package. This is necessary for L^AT_EX 2 _{ϵ} document classes that do not play nice with paralist, such as beamer. If the `\markdownOptionTightLists` is undefined and the beamer document class is in use, then do not load the paralist package either.

```

2651 \RequirePackage{ifthen}
2652 \ifx\markdownOptionTightLists\undefined
2653   \@ifclassloaded{beamer}{}{
2654     \RequirePackage{paralist}}
2655 \else
2656   \ifthenelse{\equal{\markdownOptionTightLists}{false}}{}{
2657     \RequirePackage{paralist}}
2658 \fi

```

If we loaded the paralist package, define the respective renderer prototypes to make use of the capabilities of the package. Otherwise, define the renderer prototypes to fall back on the corresponding renderers for the non-tight lists.

```

2659 \@ifpackageloaded{paralist}{
2660   \markdownSetup{rendererPrototypes={
2661     ulBeginTight = {\begin{compactitem}},
2662     ulEndTight = {\end{compactitem}},
2663     olBeginTight = {\begin{compactenum}},
2664     olEndTight = {\end{compactenum}},
2665     dlBeginTight = {\begin{compactdesc}},
2666     dlEndTight = {\end{compactdesc}}}}
2667 }{
2668   \markdownSetup{rendererPrototypes={
2669     ulBeginTight = {\markdownRendererUlBegin},
2670     ulEndTight = {\markdownRendererUlEnd},

3.3.5 Miscellanea

When buffering user input, we should disable the bytes with the high bit set, since these are made active by the `\inputenc` package. We will do this by redefining the `\markdownMakeOther` macro accordingly. The code is courtesy of Scott Pakin, the creator of the `filecontents` package.

```

2819 \newcommand\markdownMakeOther{%
2820   \count0=128\relax
2821   \loop
2822     \catcode\count0=11\relax
2823     \advance\count0 by 1\relax
2824   \ifnum\count0<256\repeat}%

```

3.4 ConTeXt Implementation

The ConTeXt implementation makes use of the fact that, apart from some subtle differences, the Mark II and Mark IV ConTeXt formats *seem* to implement (the documentation is scarce) the majority of the plain TeX format required by the plain TeX implementation. As a consequence, we can directly reuse the existing plain TeX implementation after supplying the missing plain TeX macros.

```

2825 \def\dospecials{\do\ \do\\\do\{\do\}\do\$\\do\&%
2826 \do\#\do\^\do\_\\do\%\do\~}%
2827 \input markdown

```

When buffering user input, we should disable the bytes with the high bit set, since these are made active by the `\enableregime` macro. We will do this by redefining the `\markdownMakeOther` macro accordingly. The code is courtesy of Scott Pakin, the creator of the `filecontents` LaTeX package.

```
2828 \def\markdownMakeOther{%
```

```

2829 \count0=128\relax
2830 \loop
2831   \catcode\count0=11\relax
2832   \advance\count0 by 1\relax
2833 \ifnum\count0<256\repeat

```

On top of that, make the pipe character (`|`) inactive during the scanning. This is necessary, since the character is active in ConTeXt.

```
2834 \catcode`|=12}%
```

3.4.1 Logging Facilities

The ConTeXt implementation redefines the plain TeX logging macros (see Section 3.2.1) to use the ConTeXt `\writestatus` macro.

```

2835 \def\markdownInfo#1{\writestatus{markdown}{#1}%
2836 \def\markdownWarning#1{\writestatus{markdown\space warn}{#1}%

```

3.4.2 Typesetting Markdown

The `\startmarkdown` and `\stopmarkdown` macros are implemented using the `\markdownReadAndConvert` macro.

```
2837 \begingroup
```

Locally swap the category code of the backslash symbol with the pipe symbol. This is required in order that all the special symbols that appear in the first argument of the `\markdownReadAndConvert` macro have the category code *other*.

```

2838 \catcode`\|=0%
2839 \catcode`\\=12%
2840 \gdef\startmarkdown{%
2841   \markdownReadAndConvert{\stopmarkdown}%
2842   {\stopmarkdown}%
2843 \endgroup

```

3.4.3 Token Renderer Prototypes

The code fence infostring is used as a name from the ConTeXt `\definotyping` macro. This allows the user to set up code highlighting mapping as follows:

```

% Map the 'TEX' syntax highlighter to the 'latex' infostring.
\definotyping [latex]
\setuptyping [latex] [option=TEX]

\starttext
  \startmarkdown
  ~~~ latex
\documentclass{article}
\begin{document}
  Hello world!
\end{document}
~~~

  \stopmarkdown
\stoptext

```
